Health Equity: Prioritization, Perception, and Progress

The Institute for Healthcare Improvement (IHI) aims to achieve health equity – equity of access, treatments, and outcomes – by working in collaboration with organizations, communities, and individuals to accelerate the elimination of inequities. To make progress toward this aim, IHI conducted an industry poll in July 2021 to:

- Better understand current attitudes and perceptions surrounding health equity work in the United States; and
- Identify roadblocks and challenges that exist for health care delivery organizations working to advance health equity.

Methodology

IHI's July 2021 industry poll was conducted online with health care professionals in the United States. Participants were informed that the poll required 5 to 10 minutes of their time and all responses will be anonymous, analyzed in aggregate, and used in a report published by IHI.

In total, 505 US-based health care professionals responded and 380 individuals fully completed the poll. For each question, all available data was included in the analysis conducted by health equity subject matter experts and leaders at IHI.

Method

- Online poll distributed by IHI using Survey Monkey
- 12 multiple-choice questions
- 2 questions using a five-point Likert scale

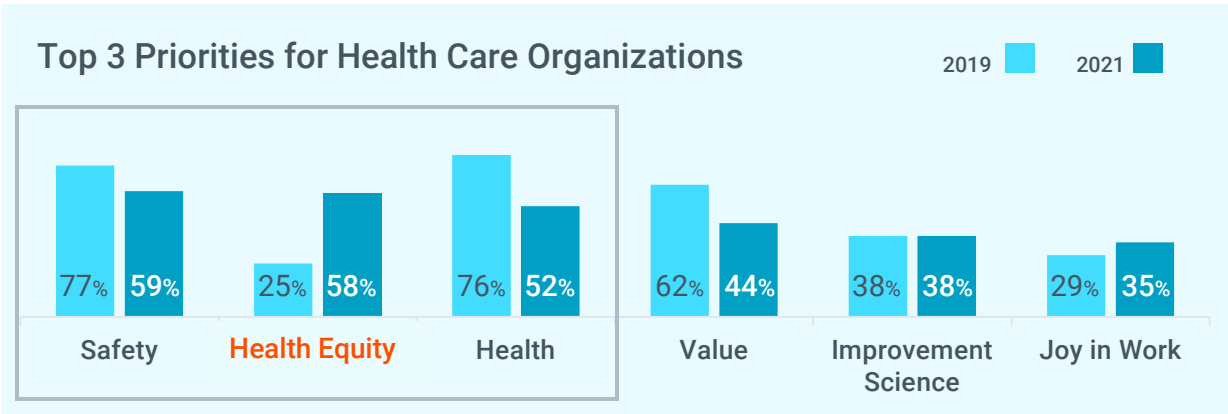

Audience

- Health care professionals from IHI's existing database (sample not stratified by demographic information, including race, ethnicity, gender, or location)
- Distribution list prioritized individuals at the Director level and above at health care delivery organizations based in the United States
- Respondents were located in 47 of 50 states and the District of Columbia
- Respondents reflected an array of positions, including C-suite leaders and Chiefs of Clinical Departments, Vice Presidents and Senior Vice Presidents, Managers and Senior Managers, Quality and Safety Officers, Physicians, Nurses, and Nurse Practitioners
- Respondents represented key care settings, including community hospitals, academic medical centers, office practices, skilled nursing facilities and nursing homes, integrated health systems, community health organizations, and government agencies

Key Findings and Takeaways

Health equity is a top priority for most health care delivery organizations.

This year, 58% of US-based health care professionals polled by IHI identified health equity as one of their organization’s top three priorities. Respondents were presented with six priority areas and asked to select their organization’s top three. Health equity ranked second, only one percentage point lower than safety. When IHI asked health care professionals the same question in 2019, only 25% selected health equity as a top priority.

Why is health equity not a top three priority for some organizations?

Respondents who did not select health equity as a top three priority clarified why:

- 22% My organization does not experience deep or persistent disparities related to characteristics such as race/ethnicity, language, sexual orientation, or geographic location.
- 19% Focusing on other priorities will have a greater positive impact on patients.
- 18% My organization does not currently have the right leaders in place to drive the work of health equity.
- 18% I don't know.
- 17% My organization has developed a health equity strategy that it is delivering on and has now moved on to other priorities.
- 12% It is not necessary based on my organization’s context (e.g., location, patient populations).
- 6% My organization does not have the funding to commit to health equity work.
- 20% Other – top themes to emerge include:
 - Health equity is a focus, but not a top three priority.
 - Health equity is being addressed through population health work.
 - Health equity is not a standalone strategy; it is embedded in everything we do.
 - My organization has more pressing priorities right now (e.g., COVID-19 and infection control, improving scorecard results).

Health care delivery organizations report myriad barriers to advancing health equity.

The IHI poll presented 10 barriers, asking respondents to select which, if any, are standing in the way of advancing health equity in their organizations. No single barrier received a majority of responses, indicating a wide breadth of challenges facing health care organizations on their journey to eliminating inequities.

Additional barriers include:

- 17% Political divisiveness surrounding the topic
- 13% Resistance from leadership and staff
- 11% Lack of in-depth knowledge of health equity efforts
- 8% Trouble finding and engaging with community partners

Analysis of the **two top-cited barriers** based on the respondent’s role at their organization led to the following findings:

- **Inconsistent collection of equity-related patient data** was the top-selected barrier among C-suite leaders (e.g., CEO, CQO, COO, CMO, CNO, Chief of a Clinical Area or Department)
- **Lack of resources other than funding (e.g., available staff)** was the most selected barrier for all other positions combined (e.g., EVP/SVP/VP, Director/Department Head, Manager/Senior Manager, Physician, Nurse)

Organizations are pursuing numerous activities to advance health equity, and most believe their efforts are at least somewhat effective.

Top responses for efforts organizations are undertaking to advance health equity include:

- 58% Incorporating health equity into the organization's strategic plan
- 56% Developing partnerships with community organizations
- 55% Capturing equity-related patient data, including race, ethnicity, ancestry, language, sexual orientation, and gender identity
- 55% Addressing equity in the hiring and promotion process

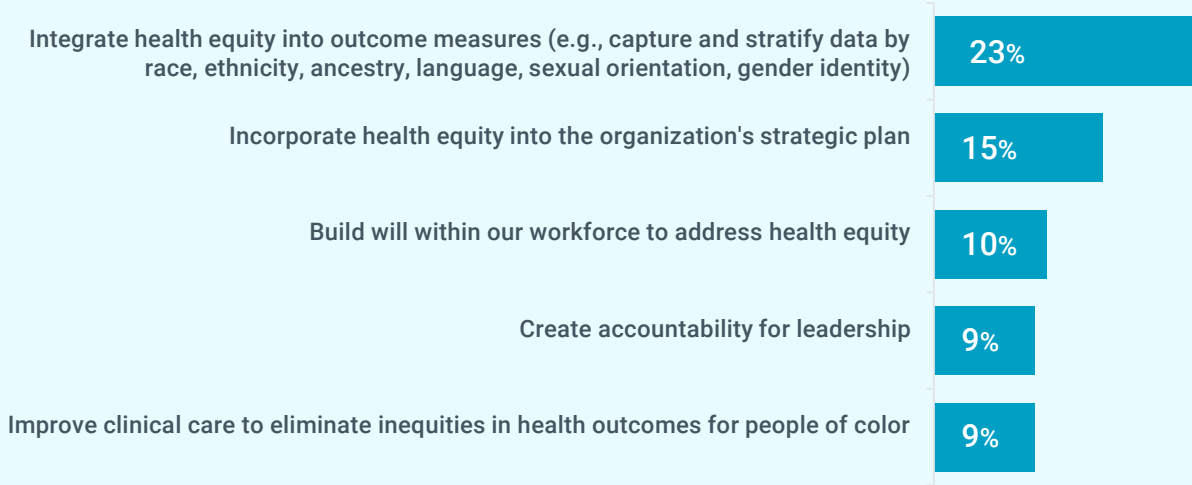

Effectiveness of Organizations' Efforts in Eliminating Inequities

To help accelerate progress, one in five respondents want their organization to start tracking equity outcome measures.

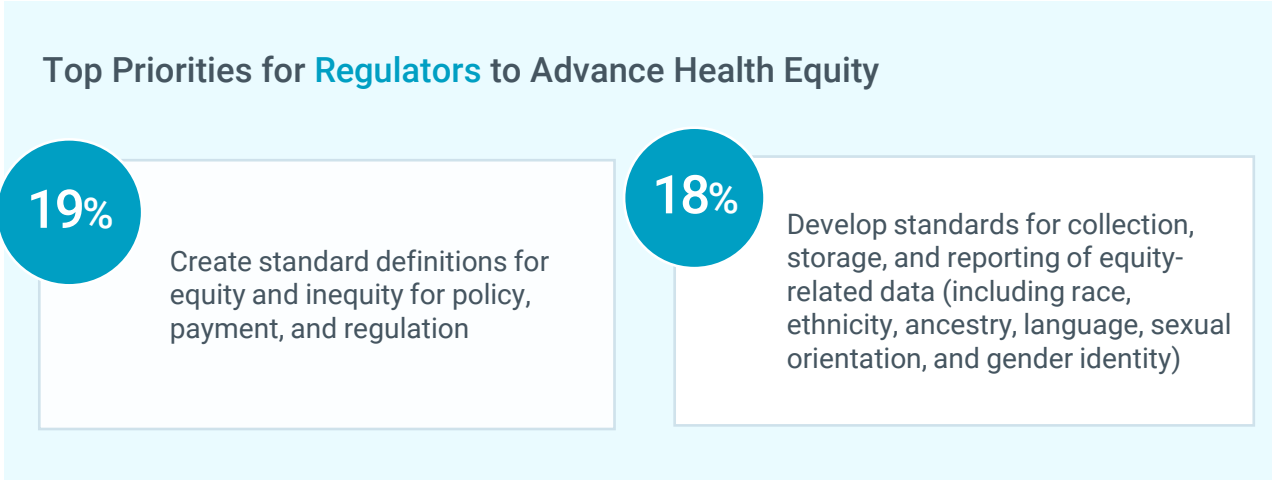

Integration of health equity into outcome measures – for example, capturing and stratifying data by race, ethnicity, ancestry, language, sexual orientation, and gender identity – was selected by 23% of respondents, and nearly 30% of C-suite leaders, as the most important thing that their organization needs to do to advance health equity.

Top 5 Responses: The Most Important Thing My Organization Needs to Do to Advance Health Equity

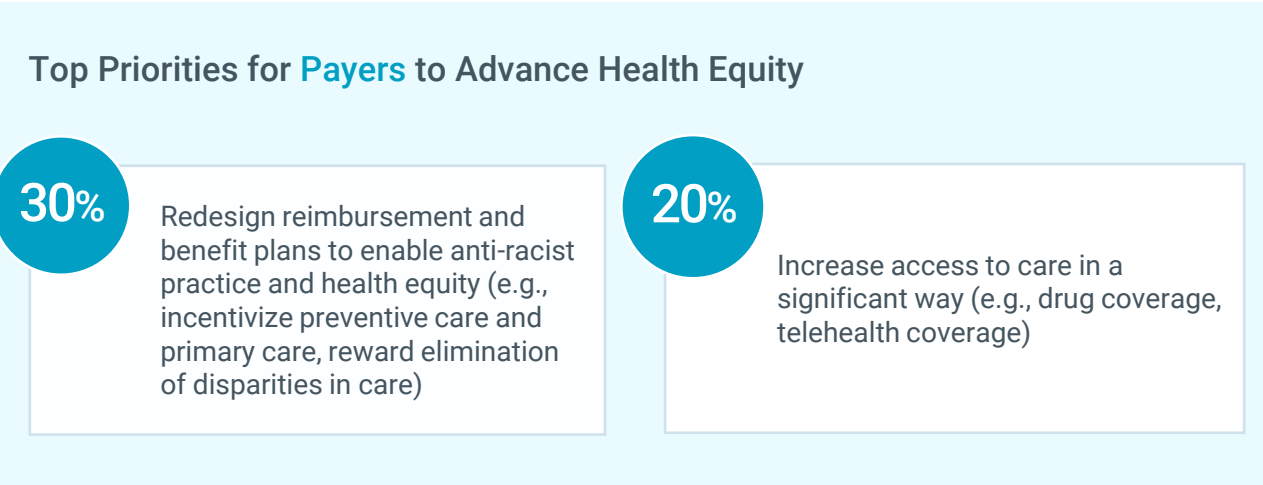

More than one in three respondents want regulators to develop definitions or standards that support equity work.

Respondents were asked to identify the most important thing that regulators need to do to advance health equity.

For payers, top priorities are clear: Redesign reimbursement and increase access to care.

Respondents were asked to identify the most important thing that payers need to do to advance health equity.

A vast majority of respondents agree: There can be no progress on health care quality and population health without health equity.

Despite myriad challenges to overcome, poll respondents are highly aligned in their agreement that progress on health equity drives improvement in health care quality and population health.
