Introduction

The Alliance for Innovation on Maternal Health (AIM) is a national data-driven maternal safety and quality improvement (QI) initiative. AIM works through state and community-based teams to align national, state, and hospital-level QI efforts to reduce preventable maternal mortality and severe morbidity across the United States.

The AIM Patient Safety Bundles are a core part of this work. To promote the successful implementation of these bundles, AIM partnered with the Institute for Healthcare Improvement (IHI) to create a series of associated change packages. This specific change package is designed to support Perinatal Quality Collaboratives (PQCs) and other state-based initiatives to leverage the AIM Care for Pregnant and Postpartum People with Substance Use Disorder Patient Safety Bundle (CPPPSUD Bundle) more effectively.1

Why is this important?

Substance use disorders (SUDs) during the perinatal period, more than any other chronic medical condition, are highly stigmatized and often associated with severe legal and personal consequences for pregnant people. Even though substance use is common across class, gender, and race/ethnicity, regulation of substance use during pregnancy is disproportionately used as an instrument of structural violence against birthing people of color and those who are low income.2

In the context of the ongoing struggle for reproductive autonomy, it critical that the care of pregnant and parenting people with substance use conditions is guided by principles of reproductive justice, defined as “The human right to maintain personal bodily autonomy, have children, not have children, and parent the children we have in safe and sustainable communities.”3 The CPPPSUD Bundle represents an effort to describe essential elements of respectful care and to provide high-level implementation guidance.

Improving care for birthing people with substance use disorders involves change across care settings and disciplines. This change package was created to provide some of the many resources available for teams implementing the AIM Care for Pregnant and Postpartum People with SUD Patient Safety Bundle and aims to destigmatize substance use disorder and lay the foundation for respectful, equitable, and supportive care for all.
What is a change package?

A change package is a document listing evidence-based or best-practice changes specific to a topic and is usually organized around a framework or model. In this case, the Care for Pregnant and Postpartum People with Substance Use Disorder Change Package is structured around the CPPPSUD Bundle.

Changes packages, including this one, are structured around the following components:

- **Primary Drivers**: Major processes, operating rules, or structures that will contribute to moving toward the aim. In this change package, the primary drivers are based on AIM’s Five Rs Framework (Readiness, Recognition & Prevention, Response, Reporting/Systems Learning, and Respectful Care).

- **Change Concepts**: Broad concepts (e.g., “move steps in the process closer together”) that are not yet specific enough to be actionable but that will be used to generate specific ideas for change.

- **Change Ideas**: Actionable, specific idea for changing a process. Change ideas can come from research, best practices, or from other organizations that have recognized a problem and have demonstrated improvement on a specific issue related to that problem.

Taken as a whole, a change package has the potential to seem overwhelming. Based on the priorities of your state and community, we encourage you to start small by testing a couple of ideas connected to the aim you set. Through iterative tests of change (also known as Plan-Do-Study-Act (PDSA) cycles), you will have an opportunity to learn what works and what does not in your efforts to improve your processes. Initially, these cycles are carried out on a small scale (e.g., one patient on one day) to see if they result in improvement. Teams can then expand the tests and gradually incorporate larger and larger samples until they are confident that the changes will result in sustained improvement.
How to prioritize changes?

No team is expected to test all the listed change ideas. Consider this a menu of options from which you may choose what to tackle first. Each team will review their baseline data, progress to date, organizational priorities, and select an area(s) to prioritize. For example, some may start with one driver. Others may start by tackling one idea across all drivers. Start by choosing an area that you think could lead to an easy win.

You can also leverage the following tools to help you decide where to start:

1. **Pareto chart**: A type of bar chart in which the various factors that contribute to an overall effect are arranged in order according to the magnitude of their effect. This ordering helps identify the "vital few" — the factors that warrant the most attention.⁴

2. **Priority matrix**: A tool that can better help you to understand important relationships between two groupings (e.g., steps in a process and departments that conduct that step) and make decisions on where to focus.⁵

3. **Impact-effort matrix**: A tool that helps identify which ideas seem easiest to achieve (least effort) with the most effects (highest impact). The ideas identified via this tool would be a great place to start.⁶
Change Package

A Note on Symbols

Respectful, Equitable, and Supportive Care

In addition to having an independent section in this change package dedicated to the CPPPSUD Bundle’s fifth R (Respectful, Equitable, and Supportive Care), all change ideas in other primary drivers that fall under this R are marked with a ◊ symbol.

Additional Considerations

It is understood that every team utilizing this change package will be at a different point in this work. If your organization is further along in your obstetrical SUD improvement work and has found reliability in some of the change ideas below, we suggest testing the additional considerations that are in *italics* and marked by the * symbol.
# Readiness

Appendix B

Instructions Before Getting Started on Buprenorphine

*Example instructions adapted from Dartmouth Health*

[Insert your institution logo and contact information here]

The process of getting someone on the correct dose of buprenorphine is divided into three phases: Induction, Stabilization, and Maintenance. Because of its interactions with other opioids (including heroin, methadone, oxycodone (Percocet), morphine (MS Contin), hydrocodone (Vicodin), methadone, or fentanyl, it is very important that you not take any opioids for at least 12 hours before you come in to start buprenorphine treatment. To avoid sudden onset of severe withdrawal symptoms (“precipitated withdrawal”), a person should be in at least moderate withdrawal when they receive their first dose of buprenorphine.

The induction process begins on Day 1 and takes place either in the office or on the Birthing Unit at [hospital address] depending on how far along you are in your pregnancy. This process can take most of the day, or you may be admitted to stay overnight in the hospital.

On Day 1, please:

- **Come to ________________ by 8:00 am.**
- **Wear comfortable clothing.**
- **Bring something to do to help pass the time, since you will be there for a while**
- **Bring another adult support person with you if you’d like, but please do not bring children. If this is a barrier, please let your provider know and we will do our best to help find solutions.**
- **Plan to spend the entire time with us in a comfortable room with a TV. We will ask that you not leave the inpatient unit during induction and stabilization. If you are starting buprenorphine in the outpatient clinic, we ask that you stay in the clinic until the maximum dose for the day has been reached.**
- **[Hospital name] is smoke-free, so if you smoke, we will offer you a nicotine patch or gum to help you stay comfortable.**

You will be asked to give an observed urine sample for a drug screening test. This is for your safety, to be avoid any possible interactions with buprenorphine. One of the nurses will do an assessment called the “COWS” (Clinical Opiate Withdrawal Scale) to measure your signs and symptoms of withdrawal every few hours.

**Induction:** You will receive an initial dose of buprenorphine, and then the COWS will be repeated every two hours and your dose increased until your withdrawal symptoms are effectively treated. The maximum dose you can receive on Day 1 is 12 mg. If needed, we will give you other medications to make you more comfortable during induction.
Stabilization: On Day 2 we may increase your dose if needed to resolve withdrawal symptoms, with a maximum dose of 16 mg on Day 2 or Day 3. This will be done either in the hospital or the clinic. The goal during the stabilization phase is to figure out the minimum dose of buprenorphine needed to eliminate withdrawal symptoms and cravings. Most people will stabilize at a dose of 16 mg per day or less.

Maintenance: After the right dose is established, we will continue to check in with you every week to make sure you are on the right dose. Some pregnant people need to increase to a maximum dose of 24 mg during the latter half of pregnancy because the way the body processes buprenorphine changes during pregnancy.

**Your Induction is scheduled on:** __________________________ at 8:00 am. If you are running late or can’t make this time work, please call the Charge Nurse to reschedule so we don’t worry about you: __________
Buprenorphine/Naloxone Initiation in Pregnancy

Example policy and procedure adapted from Dartmouth Health

I. Purpose of Procedure: To standardize buprenorphine/naloxone initiation during pregnancy.

II. Procedure Scope: Providers and RNs caring for pregnant women on the Inpatient Obstetric Unit and OB/GYN Clinic at [names]

III. Definitions

- **Buprenorphine Initiation:** Buprenorphine Initiation: Transition of substance use from illicit opioids to buprenorphine/naloxone utilizing the lowest dose needed to minimize symptoms of withdrawal and cravings and prevent use of illicit opioids.

- **Buprenorphine/naloxone (AKA Suboxone®):** Appropriate treatment for women with opioid use disorder utilizing three phases: initiation, stabilization, and maintenance.
  - A partial agonist at the mu opioid receptor and antagonist and the kappa receptor. It can precipitate an opioid withdrawal syndrome if administered to a patient who is physiologically dependent on opioids and has receptors occupied by opioids at the time buprenorphine is initiated. Note that precipitated withdrawal is caused by buprenorphine itself, and not by the naloxone on combination formulations. When buprenorphine/naloxone is used sublingually as directed, naloxone is minimally absorbed.
  - A patient should no longer be intoxicated or experiencing residual effects from her last dose of an opioid when receiving her first dose of buprenorphine/naloxone. Therefore, a period of abstinence is required (a minimum of 12-24 hours after last use of a short-acting opioid) and patients should be experiencing moderate withdrawal symptoms before initiating buprenorphine/naloxone treatment.
  - **Clinical Opioid Withdrawal Scale (COWS):** A scoring tool to quantify withdrawal symptoms and guide in the buprenorphine/naloxone initiation process. Withdrawal symptoms are classified with the following score ranges: Mild (5-12), Moderate (13-24), Moderately Severe (25-36), Severe (greater than 36).

IV. Criteria for initiation

- **Inpatient Initiation Criteria:** Women with acute medical or surgical illness, significant polysubstance use, use of long-acting opioids or who are presenting at a gestational age post-viability often require inpatient admission for close monitoring and clinical evidence of opioid withdrawal (COWS 12 or more). Women with co-occurring benzodiazepine, polysubstance, or alcohol use should be cared for in an inpatient setting, preferably at a substance abuse treatment facility and with psychiatry or addiction medicine consultation.
Outpatient Initiation Criteria: Women in the first or second trimester 20-24-28 weeks gestation without complicating factors above, and with history of opioid use disorder and clinical evidence of opioid withdrawal (COWS 12 or more) may be considered for closely monitored initiation in the ambulatory setting.

V. Procedure

Attending provider (must be waivered to prescribe buprenorphine on an outpatient basis in order to bridge patients to a destination treatment program)

- Assist patient in identifying treatment provider for follow-up after induction/stabilization
  - Obtain release of information.
- Consider psychiatric consultation if concerns related to a co-occurring psychiatric disorder.
- Notify team to provide multidisciplinary support during initiation process:
  - Inpatient and outpatient: OB care provider with buprenorphine waiver, recovery coach, etc.
  - Inpatient: Social worker, behavioral health team.
- Verify that patient has not taken an opioid for a minimum of 12-24 hours (short-acting opioid).
- Determine baseline COWS score, verifying a score of 12 or more.
  - Common physical symptoms of opioid withdrawal:

<table>
<thead>
<tr>
<th>Early Withdrawal</th>
<th>Fully Developed Withdrawal</th>
</tr>
</thead>
<tbody>
<tr>
<td>(8-24 hours after last use)</td>
<td>(1-3 days after last use)</td>

</table>

- Diagnosis: “Maternal drug use complicating pregnancy, antepartum” and “acute opioid withdrawal.”
- Initiates order set “Perinatal Buprenorphine/Naloxone Initiation.”
- Obtains baseline laboratory testing to include:
  - Urine toxicology (with confirmation, including fentanyl)
o Ethyl glucuronide/ethyl sulfate (alcohol metabolites)
  o Complete metabolic panel
  o Complete blood count (CBC) with differential and platelet count
  o Hepatitis B surface antigen, hepatitis B surface antibody, hepatitis B core antibody (IgM and Total), and hepatitis C antibody with reflex to hepatitis C quantitative RNA (unless already known positive)
  o If known hepatitis C antibody positive, draw hepatitis C quantitative RNA instead of antibody.
  o HIV (4th generation expedited)
  o Other prenatal labs, if not completed, including gonorrhea, chlamydia, and syphilis.

VI. Induction

Day 1
- Fetal assessment
  o Inpatient and outpatient: Obtain nonstress test (NST) on admission if greater than 28 weeks gestation; otherwise obtain fetal heart tones (FHT).
  o Outpatient: Assess FHTs prior to leaving the clinic at the end of day 1.
- Order buprenorphine/naloxone as indicated by the attached algorithm using the COWS assessment.
  o Do not administer more than 12 mg buprenorphine/naloxone on first day.

Day 2
- Order and adjust dose in accordance with the attached buprenorphine algorithm.
  o Do not give more than 16 mg buprenorphine/naloxone on second day.
  o A reactive NST should be obtained prior to discharge for patients with gestational age equal to or greater than 28 weeks gestation.
  o Patient may be discharged on day 2 with next day follow-up with a waivered buprenorphine prescriber in the OB clinic, or substance use treatment provider.

Day 3
- Evaluate patients still experiencing withdrawal symptoms (COWS of 5 or more) in outpatient clinic.
- May increase dose by 2 mg up to a maximum dose of 20 mg.

VII. Medications for symptom reduction
- Adjunctive therapy may be used with or without buprenorphine/naloxone initiation for the treatment of opioid withdrawal symptoms.
  o Clonidine 0.1 mg orally every 6 hours PRN withdrawal symptoms (hold if systolic blood pressure (SBP) less than 105 mmHg)
  o Dicyclomine 20 mg orally every 6 hours PRN abdominal cramps
  o Loperamide 2 mg orally every 6 hours PRN diarrhea
  o Acetaminophen 650 mg orally every 6 hours PRN pain scale 1-5
  o Acetaminophen 975 mg orally every 8 hours PRN pain scale 6-10
Hydroxyzine HCl 50 mg orally every 6 hours PRN anxiety
Diphenhydramine 50 mg orally nightly PRN sleep

VIII. Nursing responsibilities

- Assesses vital signs and FHT or NST, as ordered based on gestational age.
  - Note: A reactive NST is not a prerequisite to initiating buprenorphine/naloxone as opioid withdrawal can affect NST reactivity.
- Collects witnessed urine sample for toxicology, described above
- Collects and send ordered blood tests.
- Assesses initial COWS prior to administration of buprenorphine/naloxone, administer
  - Day 1: If COWS 12 or more give buprenorphine/naloxone 2 mg/0.5 mg sublingual. If less than 12, do not give dose until increased symptoms are reported, to avoid precipitated withdrawal.
  - Day 2: If COWS 5 or more, give total Day 1 Suboxone® sublingual dose plus additional buprenorphine/naloxone 2 mg/0.5 mg sublingual. If COWS less than 5, give total Day 1 buprenorphine/naloxone dose.
- Obtains fetal assessment as ordered (FHT or NST).
- Observes for 2 hours and repeats COWS assessment
  - If COWS less than 5, notify provider.
  - If COWS greater than or equal to 5, give the following Suboxone® sublingual dose:
    - If Day 1, administer 4 mg Suboxone® sublingual.
    - If Day 2, administer 2 mg Suboxone® sublingual.
- Observe for 2 hours, repeats COWS assessment, and notify provider.
  - If COWS less than 5 and FHTs are 110-160 bpm or NST is reactive, patient can be discharged to home.
  - If COWS 5 or more, notify provider.
- Once maximum dose is reached for the day, decrease COWS assessment frequency to every 4 hours while awake to guide administration of adjunctive medications (above).
  - Provide education as appropriate to patient and when involved to family or support member.

IX. Discharge to community-based opioid treatment programs

- The prescribing provider and team arrange follow-up with the outpatient treatment program of the patient’s choice, or with a residential treatment program.
- If the appointment cannot be made within 24 hours (i.e., weekend or holiday), arrange for waivered provider for buprenorphine/naloxone prescription as needed to bridge patient to the next available appointment, ideally providing no more than 1 week of medication.
- Prior to discharge, provide prescription for Naloxone Nasal Spray (4 mg/0.1 mL, administer 1 spray in nostril for opioid overdose, repeat in 3 minutes in other nostril PRN if unresponsive).
  - When possible, provide instructions for use of Naloxone Nasal Spray to family or support member.

Buprenorphine/Naloxone Induction/Stabilization Algorithm

Sample algorithm adapted from Dartmouth Health

Buprenorphine/Naloxone Induction/Stabilization

Day 1

Re-evaluate COWS after 1 hour: Is COWS >=5?

Day 1 dose established

Re-evaluate in 1 hour: if tolerated, repeat 2mg/0.5 mg dose

Give 2 mg/0.5mg buprenorphine/naloxone SL test dose

Wait and re-evaluate COWS in 1-2 hours

Are moderate to severe withdrawal symptoms present? COWS >=12

NO

YES

Repeat 4 mg/1mg buprenorphine/naloxone every 2 hours for COWS>=5 to a maximum of 12 mg/3mg during the first 24 hours

Buprenorphine/Naloxone Induction/Stabilization

Days 2-3

Discharge on Day 3 with Rx for maximum dose established and close follow up with Treatment provider

If COWS >=5, may increase to 20 mg/5 mg buprenorphine/naloxone on Day 3

Repeat 2 mg/0.5 mg bup/naloxone every 2 hours if COWS >=5 to maximum dose of 16 mg

Is COWS >=5?

NO

YES

Daily dose established

Discharge with Rx for maximum dose established and Day 3 follow up by phone or in-person

Administer total Day 1 dose as established

Since last dose, were COWS >=5

NO

YES

Administer Day 1 dose plus 2 mg/0.5mg buprenorphine/naloxone and observe x 2 hours

Examples of Questions to Cover in Clinician Trainings

1. What do the state laws require?
   a. Is drug testing required?
   b. Are providers required to call your state’s version of child protective services (CPS) if drug use is suspected DURING pregnancy?
   c. Are providers required to call CPS if drug use is suspected at birth?

2. Does the institution have a written policy about mandated reporting?

3. What are the criteria for reporting in the institution (e.g., is “nonprescribed drug use” a criterion? Does this include cannabis in states where it’s not legal?)

4. Is the policy of the institution based on the inaccurate assumption that substance use by a pregnant person is an indicator of poor parenting? Or is mandated reporting based solely on concern for abuse or neglect of a child?)

5. What is the process for deciding whether a report will be made (team approach, individual provider — who/when/how)

6. How is the parent informed that a report will be made, and are they present when it is made

7. What usually happens after a report is made?
